- *Professors:* Vagan Terziyan (Head), Timo Tiihonen (Contact person);
- *Postdocs:* Olena Kaykova, Oleksiy Khriyenko;
- *Ph.D. students:* Michal Nagy, Michael Cochez;

Main goals of research

Global Understanding Environment (GUN) - Ubiquitous Eco-System for Ubiquitous Society, which is such proactive, self-managed evolutionary Semantic Web of Things, People and Abstractions where all kinds of entities can understand, interact, serve, develop and learn from each other.

Design of distributed and self-managed Web-based and mobile applications, platforms, ecosystems and services which are:

- Able to automatically discover, compose and integrate heterogeneous components;
- Able to manage heterogeneous data/knowledge/intelligence sources;
- Able to create, deploy and exploit linked data;
- Able to browse and filter information based on semantic similarity and closeness;
- Able to create, exploit and visualize context-sensitive mashups and meshups;
- Able to perform automated and user-driven application/service orchestration and choreography;
- ...

... and utilizing for that emerging Knowledge-, Agent-, SOA-, Cloud Computing-, Machine-Learning-, Mobile-, Context-Aware- and Semantic Web-based technologies and tools.

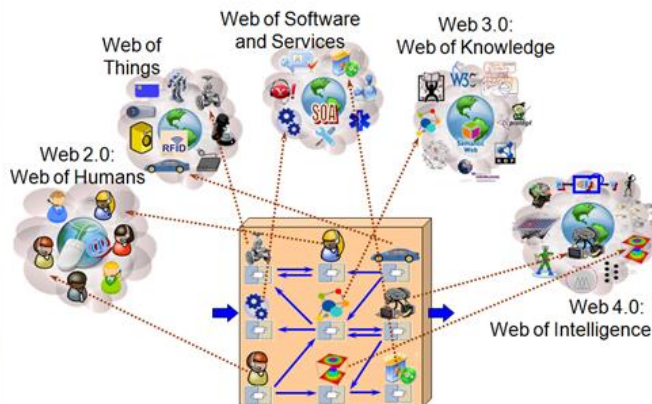

JYVÄSKYLÄN YLIOPISTO **Global Understanding Environment (GUN)**
(Industrial Ontologies Group)

GUN is a kind of Ubiquitous Eco-System for Ubiquitous Society, which is such proactive, self-managed evolutionary Semantic Web of Things, People and Abstractions where all kinds of entities can understand, interact, serve, develop and learn from each other.

GUN = Global Environment + Global Understanding =
= Proactive Self-Managed Semantic Web of Everything

Adding a "virtual representative" to every resource solves the global interoperability problem. Intelligent agent (a kind of "software robot") will act, communicate and collaborate on behalf of each Web resource

SmartResource

Tekes Project (2004-2006)

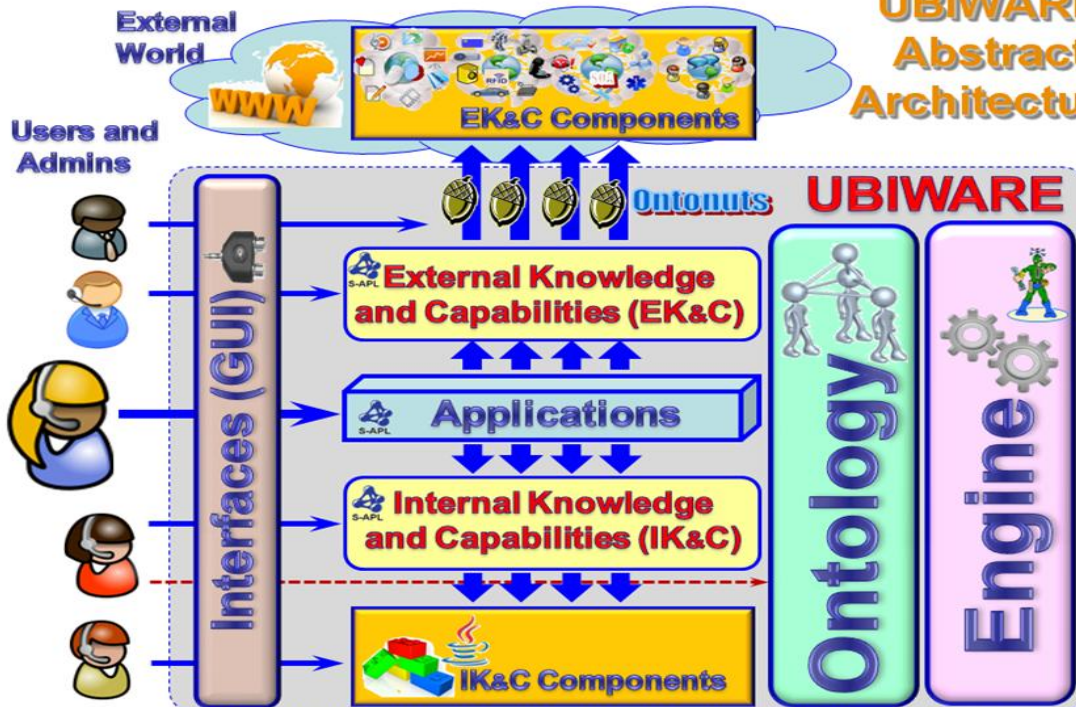

- SmartResource: "Proactive Self-Maintained Resources in Semantic Web" Tekes project (2004-2006) done by IOG.
- Project site: <http://www.mit.jyu.fi/ai/OntoGroup/SmartResource.htm>
- One of the most essential results of the SmartResource project was creation of the "Smart Resource Technology" for designing complex software systems. The technology allows considering each traditional system component as a "smart resource", i.e. proactive, agent-driven, self-managing. Such approach has shown certain advantages comparably to other software technologies, e.g. OOSE, SOA, Component-Based SE, Agent-Driven SE, Semantic SE, etc.

SmartResource project - our first step towards GUN

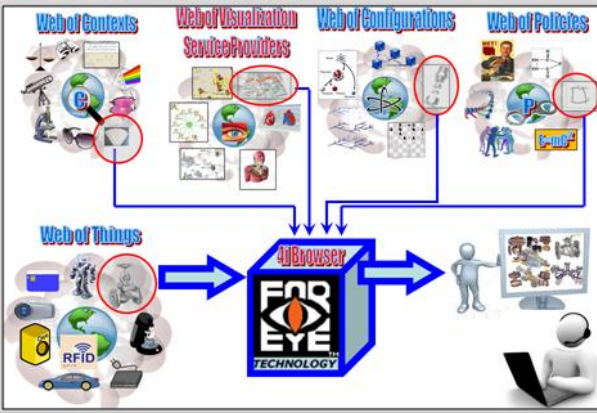

UBIWARE Abstract Architecture

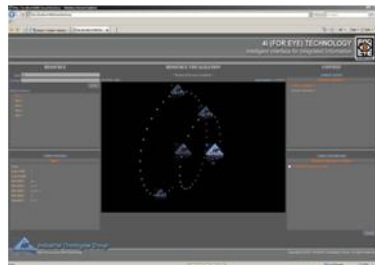

4i Philosophy – "Visualization-as-a-Service"

4i-Browser is able to select resources from a semantic repository, which are semantically close to a given resource in certain customized context, and visualize (also with the help of external services) both: the resources and the closeness

We decided to put the resources on a spiral that lies on a surface of the cone. The minimal distance between the resources has been taken as a step on an axis/height of the cone. Just that parameter (distance on the axis/height) shows the closeness of the resources.

To avoid an overlap (in case of a viewpoint from the top of the cone) of the images that belong to resources located next to each other, we have calculated the location angle (α) on each (step-based) cone cut. Additionally, we provided a possibility to rotate the cone to find the best view point.

Numbers
 $d(v_1, v_2) = \frac{|v_1 - v_2|}{v_{max} - v_{min}}$ where v_{max} and v_{min} are the maximum and minimum values from the sample

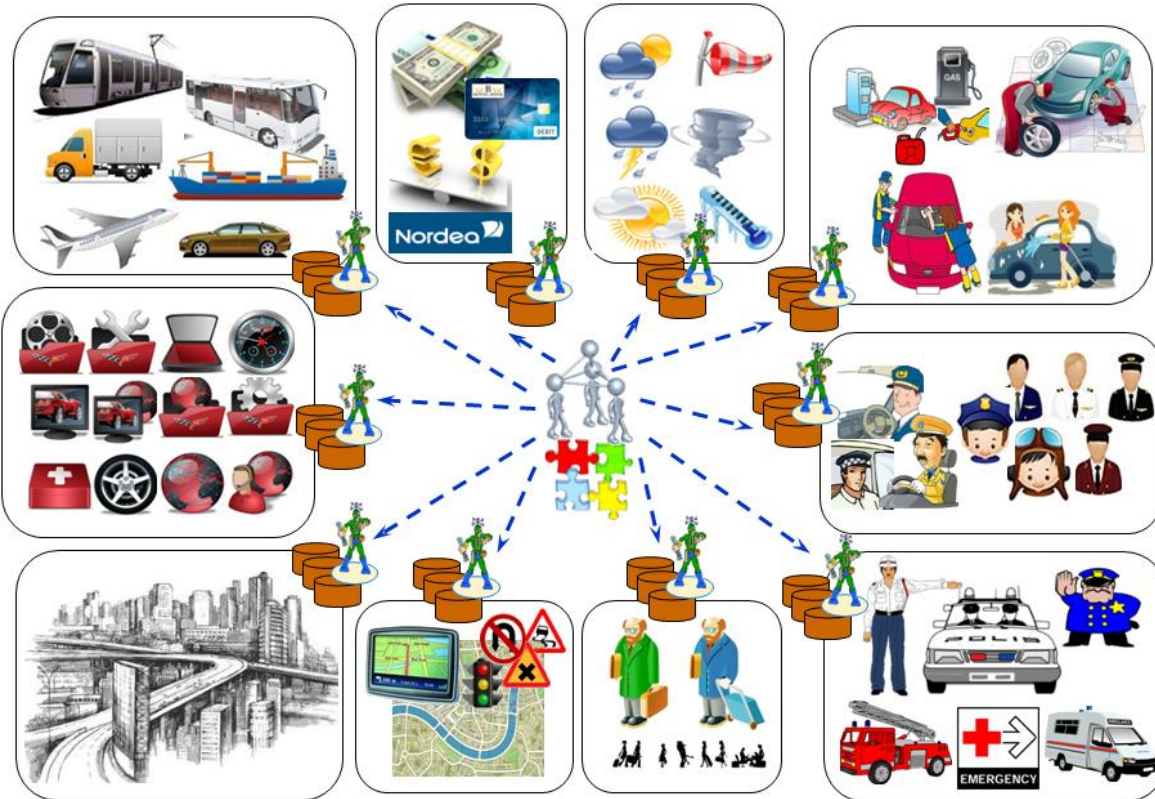

Intervals
 $d([a_1, b_1], [a_2, b_2]) = \frac{D - r}{\Delta_1}$
 $r = \frac{1 + \sqrt{1 - 4(a_1 - b_1)(a_2 - b_2)}}{2}$
 $D = \max(b_1, b_2) - \min(a_1, a_2)$
 $\Delta_1 = \max(b_1 - a_1, b_2 - a_2)$

Strings
 Test field type 2: $D(X, Y) = \frac{M}{N}$ where M is a number of match/requal instances and N is a general number of all instances in the sets of two comparable objects.
 Test field type 3: $d^2(v_1, v_2) = \sum_{i=1}^n \left(\frac{c_{1i} - c_{2i}}{c_{1i} + c_{2i}} \right)^2$, $d(v_1, v_2) = \sqrt{\frac{\sum_{i=1}^n d^2(v_1, v_2)}{n-1}}$
 $D(V_1, V_2) = \sqrt{\sum_{v_1, v_2 \in V_1 \cap V_2} \alpha_i \cdot d(v_1, v_2)^2}$

General distance between to objects:
 $D(X, Y) = \sqrt{\sum_{v_1, v_2 \in X \cap Y} \left(0.5 + \frac{d(v_1, v_2) - \alpha}{\max\{d(v_1, v_2) - \alpha\}} \right)^2}$

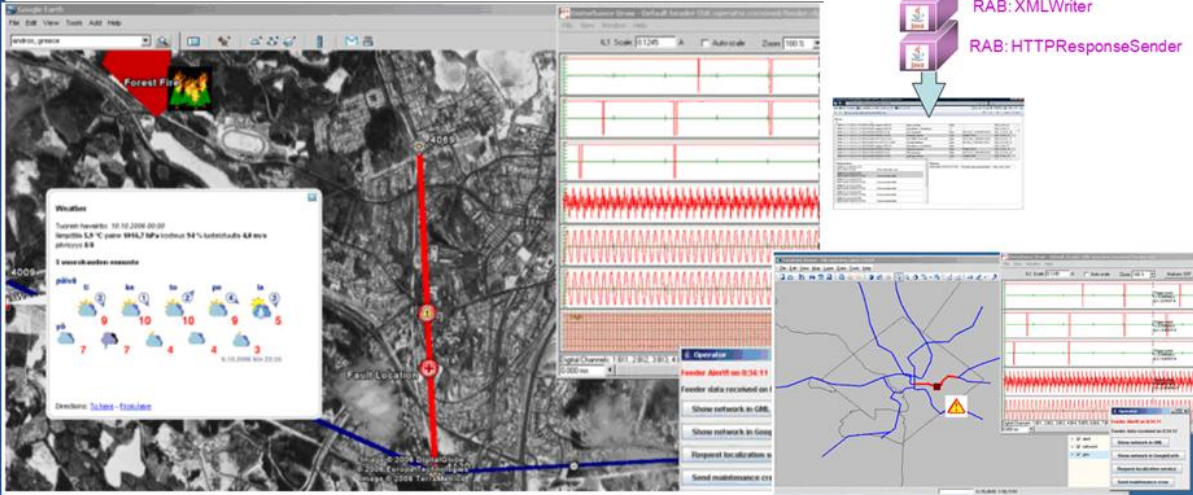

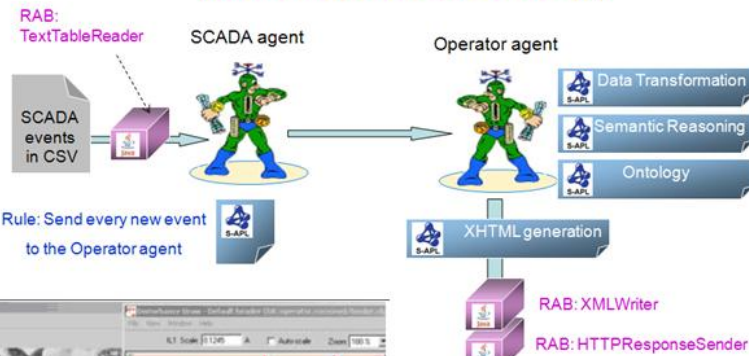

Closeness of two resources (objects) equals: closeness = 1 - D

UBIWARE-Driven Distributed Data Sources Management (OntoNuts-supported)

Semantic Monitoring of Power Networks on UBIWARE Platform (Industrial Ontologies Group)

Software application on top of UBIWARE platform done as a case study to demonstrate added value of Semantic and Agent technologies for power network maintenance. Application connects different sources of information and service providers with some decision logic and visualizes results as a semantic mashup.

"Mashupper" for Social Networks (Industrial Ontologies Group)

Smart Social Phonebook

Industrial Ontologies Group!
University of Jyväskylä

UBIWARE-Driven

Introduction

The use of mobile internet, localization and social applications has rapidly increased in the last few years. Despite the increasing capabilities of modern communication devices, the use of cloud infrastructure brings several benefits to mobile applications.

We base our work on a multi-agent platform called Ubiware, which utilizes semantic technology to integrate data from different heterogeneous sources. We use Ubiware to build a cloud application called Smart Social Phonebook (SSP). SSP integrates user's friends' data (name, email address, phone number, etc.) from different social networks (Facebook, LinkedIn, Twitter, etc.). SSP periodically communicates with the phone and sends social network data updates, which are stored in Soprano storage on the phone.

Benefits

1. Saving computational resources. The computation is happening in the cloud, not on the device.
2. Minimizing data transfer. Only differential updates are sent. No need to manage huge social network data on the device.
3. Scalability. Easy integration of other data sources.
4. Universality. The data is available to any application on the device.

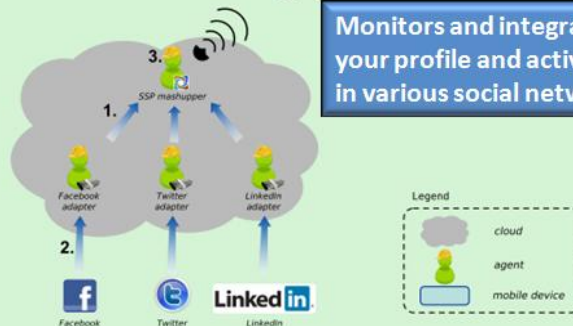

Concerns

1. Privacy. The user needs to provide access information about his/her social network account(s).

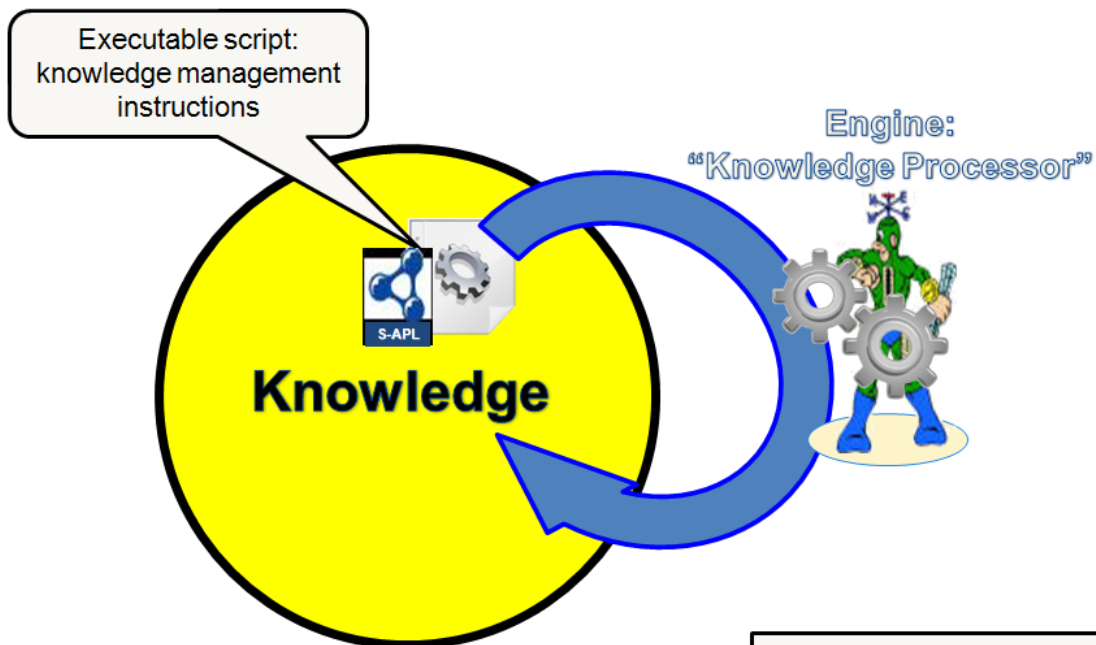

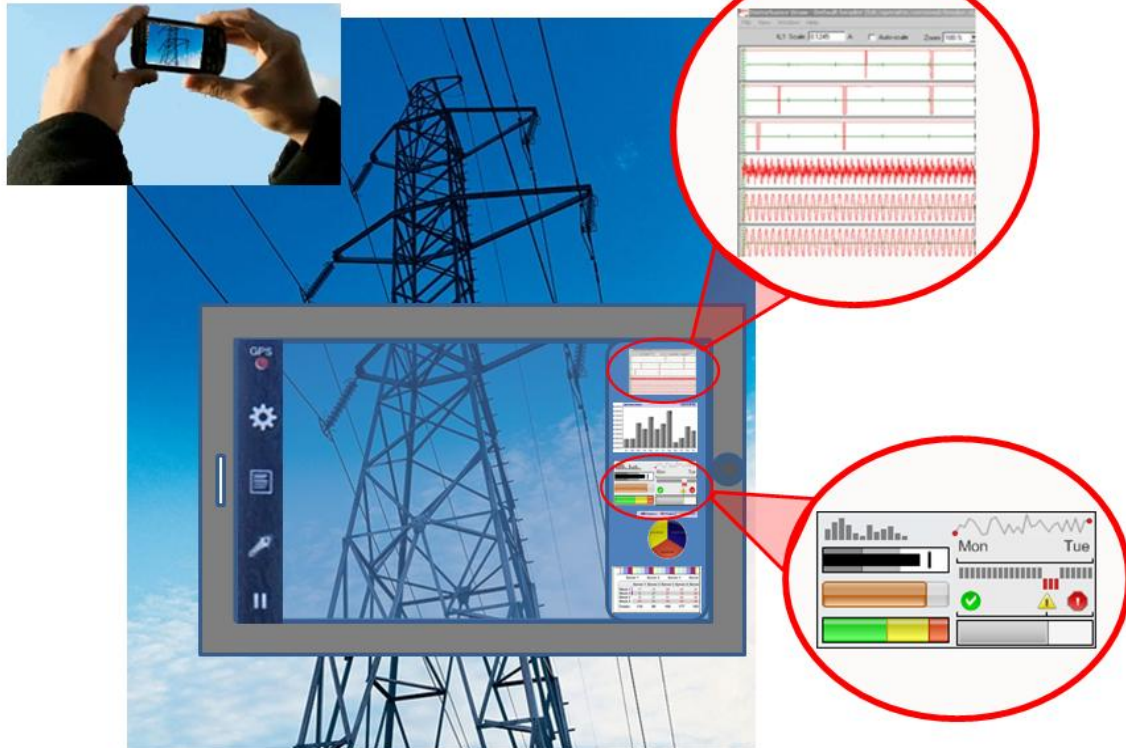

1. An adapter agent is reading each friend's data from the external data source and sends it back to SSP mashupper.
2. SSP mashupper agent is periodically requesting data from all adapter agents.
3. SSP mashupper compiles the data and updates the friends' network.
4. Whenever the mashupper client has network access, it queries the SSP mashupper from the cloud and asks for friends' information updates.
5. All friends' data are pushed into Soprano through SSP phone client.
6. Any local phone application can utilize the friends' data.

Monitors and integrates your profile and activities in various social networks

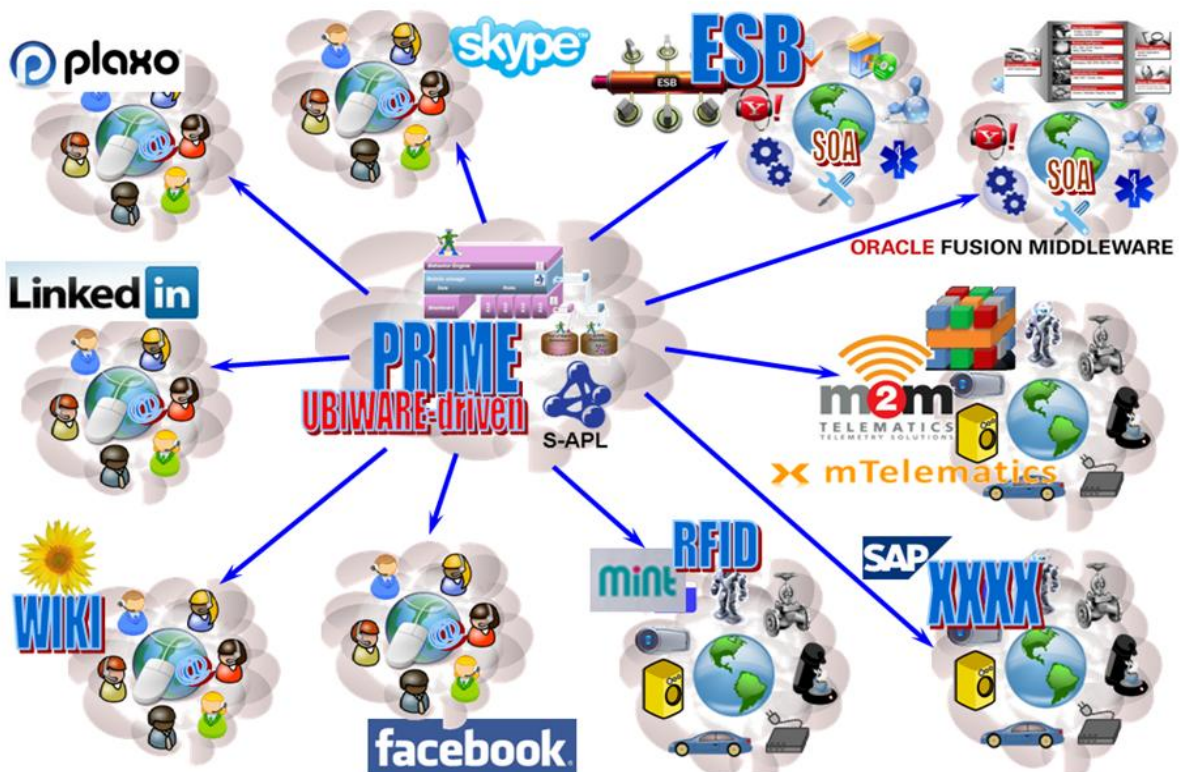

Conclusion

SSP application supports the strategic agenda declared by the Cloud SW program by introducing a mobile client-oriented cloud application. SSP utilizes cloud infrastructure to perform computationally expensive and connection-intensive tasks. We apply innovative agent-driven middleware platform to handle proactive data collection and information integration tasks in the cloud. Next we populate the information obtained to the semantic storage on the mobile phone. The data can be accessed by a variety of mobile applications.

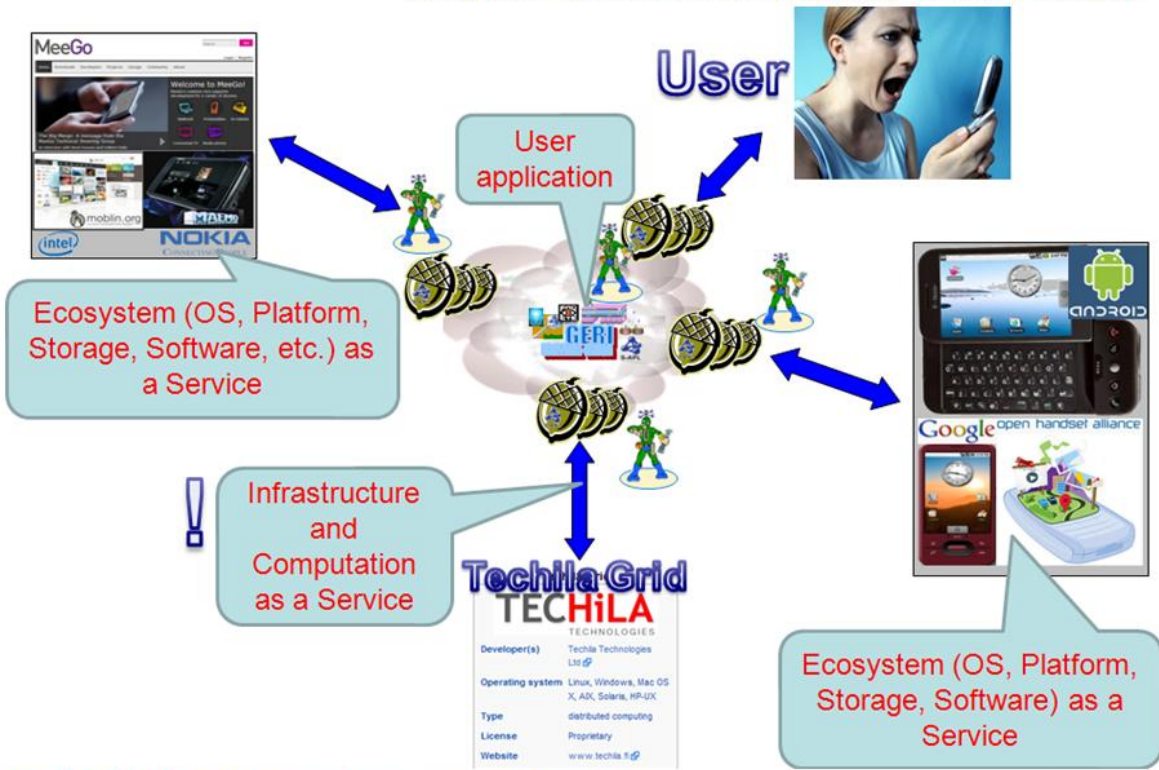

Executable Knowledge is such a knowledge, which contains explicit (executable) instructions on how to manage itself (i.e. self-management enabled)

Knowledge Computing – Executable Knowledge Management [Industrial Ontologies Group]

Business case

Business challenge
Multichannel communication is increasingly challenging as the amount of channels evolves and the actions need to be coordinated towards customers.

You might think of your business in the context of channel silos, but your customers think differently.

Cloud communication service
- Easy mean for different systems to implement communication through different channels
- A way to gather, measure and understand communication regardless of channel. Manage communication threads.
- Enabling a multichannel hub to orchestrate the communication

Architecture

API

- Security
 - Token
 - User & Password
- Message elements
 - Subject
 - Content
 - Content type
 - Message format
 - Personalization
- Interaction elements
 - Thread
 - Purpose
 - Direction
 - Channel
- Participants element
 - Sender
 - Receiver

Components

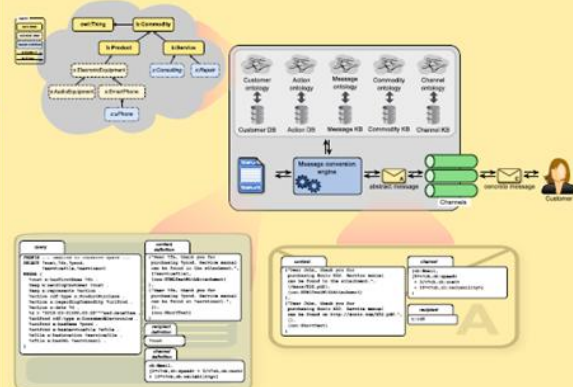

- Abstract message**
 - known user ID, but not address yet
 - known several channel-dependent texts
 - channel defined using a utility function
- Concrete message**
 - known concrete address
 - known concrete text with attachments
 - known concrete channel

Data
- modelled using ontologies (written in OWL)
- stored in RDF
- queried in SPARQL

Message template
- Prescription for abstract message generation
- Recipient(s) defined a by set of user preferences
- Content defined using variables
- Abstract channel defined through utility functions

Communication channel
A way to send and/or receive a message (email, SMS, Facebook message, Tweet, etc.)

JYVÄSKYLÄN YLIOPISTO IOG-Driven: New International and Interdisciplinary Master Program: WISE

WISE: "Web Intelligence and Service Engineering"

International Master Program

Department of Mathematical Information Technology,
University of Jyväskylä, Finland

<http://www.cs.jyu.fi/ai/WISE.pdf>

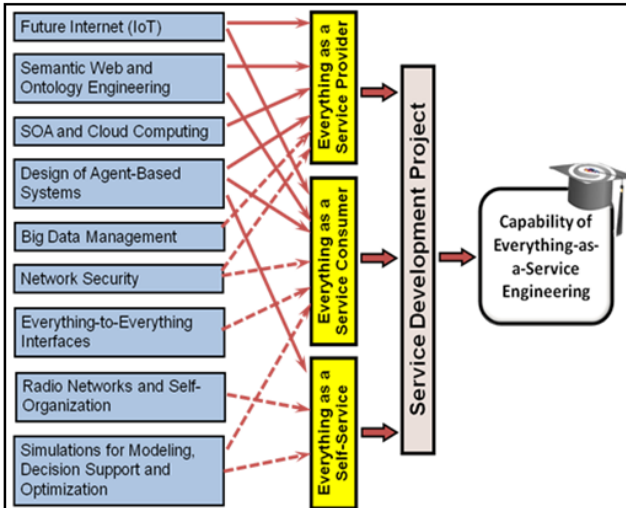

APPLY NOW!

Deadline for applications: 15 February 2013 for studies starting in September 2013.

Key Objective: Everything-as-a-Service Engineering: Designing intelligent software applications for the web-based service economy .

Official Web Site of the WISE Program: <https://www.jyu.fi/en/studywithus/programmes/wise>

Program Mission : on completion of the programme, the graduates will be able to use and design complex self-managed Web-based public and industrial systems, *digital ecosystems*, platforms, services and applications; will be able to connect their designs with publicly available data and Web-based capabilities as services; will be able to figure-out and approach various challenging aspects of wicked problems world-wide, which require self-managed service-based architectures for their solutions; understand and professionally utilize for that purpose knowledge on enabling technologies and tools; perform academic doctoral level studies; will be skilful in international communication due to the integrated language and communication studies. Students, who will graduate from the programme with a Master of Science in Natural Sciences from the Department of Mathematical Information Technology, will think beyond the routine and will be able not just to adapt to a change but to help to create and control it.

UNIVERSITY OF JYVÄSKYLÄ Our recent plan for FP7

Objective ICT-2013.5.1 Personalised health, active ageing, and independent living
Target outcome: (c) Personalised Services for Independent Living and Active Ageing
Funding scheme: STREP, approximate EC contribution budget ~3 M €

Title: ICT integrated care empowering seniors for active and healthy ageing
Acronym: AHAPower

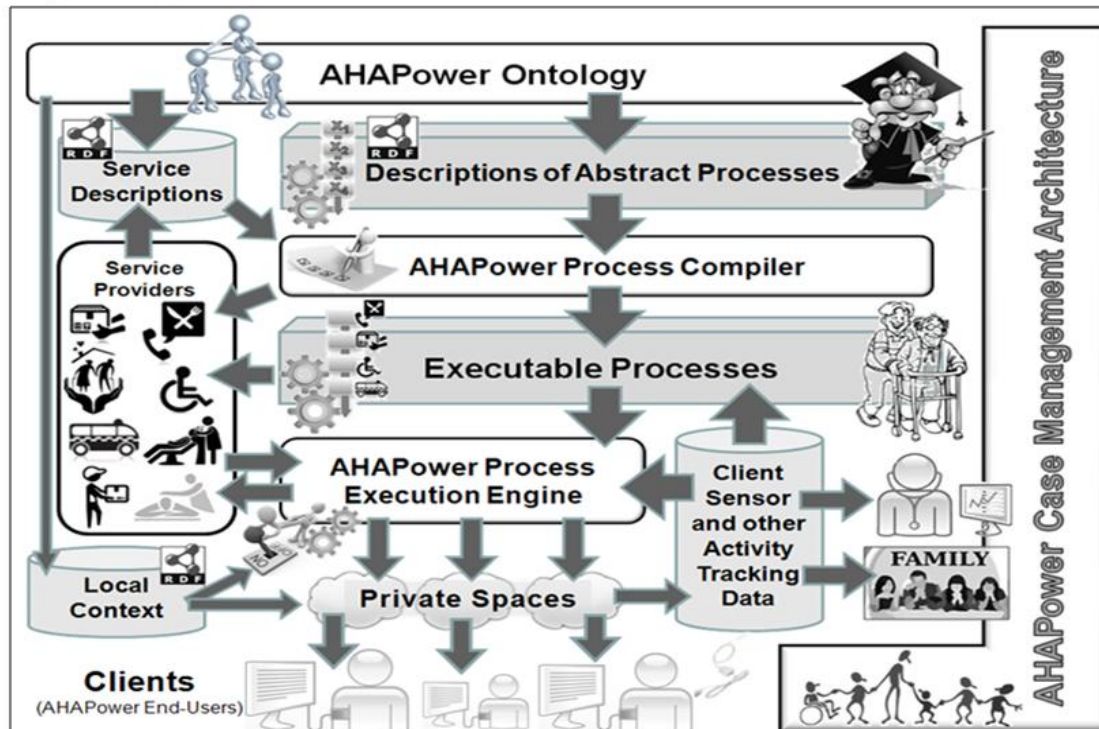

Figure: AHAPower Case Management Service-Oriented Architecture
